Hiring Team
Nintendo Software Technology Corporation
Redmond, WA

Re: Software Engineer II (NST)

Dear Nintendo Software Technology Hiring Team,

I am writing to express my strong interest in the **Software Engineer II (NST)** position at Nintendo Software Technology Corporation. Over the past five years at Electronic Arts (four years as a Gameplay & Animation Software Engineer at **Maxis** on *Project Rene* (*The Sims*) and currently at **Lifestyle**), I have focused on building responsive, high-performance player-facing gameplay systems and production tools in C++ while partnering closely with designers, artists, QA, and fellow engineers. I would be thrilled to bring my passion for fluid gameplay feel and technical craftsmanship to Nintendo Software Technology in Redmond.

During my tenure at **EA Maxis Studios**, I implemented core player-facing locomotion and runtime animation systems in Unreal Engine 5 and C++, including motion-matching, direct/indirect control schemes, and custom IK solvers, to deliver responsive, tactile character controls. I also architected a multi-threaded, asynchronous path-planning and navigation API that enabled deterministic routing and real-time obstacle avoidance for shared multiplayer simulation. Working across a large-scale multi-disciplinary codebase, I partnered directly with gameplay designers and technical animators to prototype, iterate, and polish gameplay features from concept through implementation and delivery. To support rapid design iteration and stability, I authored in-editor tuning tools and visual debuggers and profiled runtime memory and compute across character evaluation graphs and spatial queries.

In my current role at **EA Lifestyle**, I have continued engineering high-throughput runtime C++ systems and project utilities, building an Unreal Engine C++ plugin that captures and exports runtime character trajectory, pose, and velocity state to drive motion-matching locomotion query databases, alongside an extensible Python/Maya animation tool adopted across multiple internal studios. Beyond my studio work at EA, I have engineered a custom C++ game engine (*Hoowan Game Engine*) featuring an entity-component system, input polling, and collision resolution pipeline, as well as a 3D first-person shooter (*DoomSlop*) with responsive movement and camera controls, hitscan weapon raycasting, combat state feedback, and a custom radar minimap.

As an engineer based in the Seattle/Eastside area with a deep appreciation for Nintendo's standard of quality and player-first design, I am excited about the opportunity to collaborate onsite with NST's team in Redmond to deliver polished, memorable gameplay experiences. Thank you for your time and consideration, and I look forward to discussing how my experience can contribute to the team.

Sincerely,

Juan Becerra
