Romain Almes
Hiring Manager — EA Studios - Respawn (*Apex Legends*)
Electronic Arts
Vancouver, BC / Los Angeles, CA

Re: Gameplay Engineer (Apex Legends) (Role ID: 216048)

Dear Romain Almes,

I am writing to express my strong interest in the **Gameplay Engineer (Apex Legends) (Role ID: 216048)** position at Respawn Entertainment. Over the past five years at Electronic Arts—four years as a Gameplay & Animation Software Engineer at **EA Maxis Studios** on *Project Rene* (*The Sims*) and currently at **EA Lifestyle**—along with my prior live-service AAA experience at **Lionbridge**, I have focused on building responsive, high-performance player-facing gameplay systems in C++ while partnering closely with designers, animators, and QA. I would be thrilled to bring my passion for fluid movement, moment-to-moment gameplay feel, and rigorous frame-budget engineering to *Apex Legends*.

During my tenure at **EA Maxis Studios**, I implemented core player-facing locomotion and runtime animation systems in Unreal Engine 5 and C++—including motion-matching, distance matching, and custom IK solvers—to deliver responsive, tactile character controls. I also architected a multi-threaded, asynchronous path-planning and navigation API in C++ that operated reliably within a strict <1.5ms frame budget. Working across a large-scale multi-disciplinary codebase, I partnered directly with gameplay designers and technical animators to prototype features, iterate on gameplay feel, and build in-editor tuning tools and visual debuggers that accelerated authoring loops. When dense simulation scenarios introduced performance bottlenecks or regressions, I profiled runtime memory and compute across character evaluation graphs and spatial query sweeps to eliminate hitches and maintain frame stability.

In my current role at **EA Lifestyle**, I have continued bridging runtime C++ engineering and cross-disciplinary workflows—engineering a high-throughput Unreal Engine C++ plugin that exports runtime character trajectory, pose, and velocity data to populate motion-matching query databases, as well as building Maya/Python and PyTorch/ONNX authoring tools adopted across multiple internal EA studios. Beyond my studio work, I have built a custom C++ game engine (*Hoowan Game Engine*) with an EnTT ECS and collision resolution pipeline, as well as a 3D first-person shooter (*DoomSlop*) featuring hitscan weapon raycasting and radar minimap systems.

As an internal EA engineer with a deep appreciation for *Apex Legends*' industry-leading movement and combat feel, I am excited about the opportunity to collaborate with Respawn's designers and engineers to deliver polished, scalable features for a live multiplayer audience. Thank you for your time and consideration, and I look forward to discussing how my experience can contribute to the *Apex Legends* team.

Sincerely,

Juan Becerra
