Samy Duc
Hiring Manager — EA Studios - Respawn (*Apex Legends*)
Electronic Arts
Los Angeles, CA / Vancouver, BC

Re: Gameplay Data Science Engineer (Apex Legends) (Role ID: 216112)

Dear Samy Duc,

I am writing to express my strong interest in the **Gameplay Data Science Engineer (Apex Legends) (Role ID: 216112)** position at Respawn Entertainment. With over five years of experience in the games industry—including four years as a Gameplay & Animation Software Engineer at **EA Maxis Studios** and my current role at **EA Lifestyle**—combined with my ongoing graduate coursework in Machine Learning & Deep Learning at the **University of Washington**, my work sits directly at the intersection of C++ engine-level gameplay systems, agent navigation and behavior architectures, and Python/PyTorch machine learning pipelines. I am excited by the opportunity to help advance intelligent bot behaviors and scalable AI frameworks for *Apex Legends*.

In my current role at **EA Lifestyle**, I bridge runtime engine data extraction and machine learning workflows. I engineered a high-throughput Unreal Engine C++ plugin that captures, structures, and exports runtime character trajectory, pose, and velocity datasets to train and populate motion-matching query databases. In parallel, I prototyped and integrated ML-assisted pipelines using Python, PyTorch, and ONNX Runtime into authoring workflows for automated asset tagging and procedural pose generation, and architected cross-studio Python data-processing tools that reduced manual workflows by over 70%.

Previously at **EA Maxis Studios** on *Project Rene* (*The Sims*), I focused on engine-level agent navigation, locomotion, and behavior tooling in C++. I architected a multi-threaded, asynchronous path-planning and navigation API in UE5/C++ that delivered deterministic agent routing and real-time obstacle avoidance within a strict <1.5ms frame budget. I also partnered closely with gameplay designers to build in-editor tuning tools and visual debuggers for complex agent behavior trees, while profiling and optimizing runtime compute and memory across evaluation graphs and spatial query sweeps to maintain frame stability during dense multi-agent simulations.

Combining hands-on C++ gameplay and AI systems engineering with practical Python, PyTorch/ONNX, and SQL data pipeline experience—further reinforced by my graduate studies in Machine Learning and Deep Learning—I am eager to help Respawn translate creative design goals into high-performance, realistic agent behaviors for *Apex Legends*. Thank you for your time and consideration, and I look forward to the opportunity to speak with you.

Sincerely,

Juan Becerra
